Research Project!

Prove you have the skills to stay relevant, and improve your abilities to do so.

HTML5 is incomplete at this stage, but as with all emerging web technologies, its being supported by some browsers already, while the industry is largely ignoring the standard at this time, new recruits into companies will likely have an advantage if they can bring new technology know-how with them. Basically, if you cant research effectively, you cant be an effective web developer!

So, get used to it ;b

Luisa and Chris will be checking your work on Monday, so if you have done little or no research today, you might not want to ask us to be a referee for your CV, because when your prospective employer asks us "*how are there problem solving and research skills?*", (which by the way they frequently do), we wont have very much to say!

Good research is more than just a list of copy and pasted URLs by the way,
An excellent research document contains background, factual data from reliable sources, examples, credited articles, screenshots, and a summary of critical points, just to name a few...

Goodluck!
